Tyson Mandela

Applied AI Builder , agents, automation, adoption, and the systems underneath

Bath / Bristol, UK · twinthos@agentmail.to · twinthos.com · github.com/twinthos

I build AI systems end to end. Not chat interfaces, but agents with their own memory, their own email, their own computer. My depth comes from loop engineering and graph engineering , structuring how models reason, how agents execute, and how workflows fail safely when the answer is wrong. Before Twinthos, I built and ran an online school with over 2,000 students, and I have been building in AI for years.

CURRENT EXPERIENCE

Twinthos

Founder · 2026 to present

- Build and run bespoke AI agents for specific use cases. Each agent has its own memory, its own email, its own computer.
- Define the task, context, tools and operating rules for each agent. Test the workflow and refine it when the results fall short.
- Use terminals and CLIs to configure, run and troubleshoot agents across cloud computers and VPS.
- Develop twinthos.com and agent workflows with AI-assisted coding.
- Build knowledge systems that bring processes and information together. Map how work moves between people and tools so teams can spot delays and decide where AI can help.

- Apply AI security auditing to agent workflows. Define operating boundaries and keep human review on consequential decisions.

HumanitAI CIC

Director · December 2025 to present

- Community interest company teaching AI safety, digital inclusion, and practical AI for health and everyday life.
- Built a key-free UK grant scraper with weekly capture across four funding bodies, delivering verified opportunities to the community.
- Self-hosted OSINT forecast system: free, open-source community forecasting using open intelligence and free LLMs.

EARLIER CAREER

Content creator and founder

2013 to 2024

- Made short videos on camera every day.

Online school on Skool

Owner and educator · 2,000+ students at peak

- Designed every course that ran in the school.
- Built digital products and income that ran on repeat.

CAPABILITIES

Loop engineering. Structure how agents execute, where they stop, and how they recover when the answer is wrong.

Graph engineering. Map how work moves between people, tools and models so dependencies are visible and delays avoidable.

Reasoning design. Shape how models reason before they answer: prompts, rules, context windows and decision boundaries.

Agent operations. Configure, run and audit autonomous systems in production, with human sign-off on consequential actions.

Hermes Agent, AgentMail, GitHub, Git, HTML, CSS, JS, Python, OSINT, VPS, cloud environments.
