Tyson Mandela

Applied AI Builder - agents, automation, adoption, and the systems underneath

Bath / Bristol, UK · hello@twinthos.com · twinthos.com · github.com/twinthos

I build and test AI systems end to end. Not chat interfaces - agents with a written job spec, a defined decision boundary, an audit trail, and a human sign-off before anything consequential ships. My depth comes from developing, breaking, and fixing real systems, not from prompting a consumer product. Before Twinthos I built an online school with over 2,000 students and reached around 20 million views a month. I wrote six books under a pen name and sold the brand to focus on AI.

~20M
organic views / month at peak

2,000+
students, courses designed by me

CURRENT EXPERIENCE

Twinthos

Founder · 2024 to present

- Design and ship managed digital employees - AI agents with their own inbox, phone, computer and memory - for property, recruitment and accountancy.
- Write the agent job spec first: inputs, decision rights, escalation path, audit trail. No agent touches work without a written rule and a human sign-off on anything consequential.

- Build the infrastructure: Python pipelines, REST APIs, webhooks, knowledge graphs, static-site deployment and disaster recovery with hourly mirror and byte-identical restore.

HumanitAI CIC

Founder · December 2025 to present · Companies House 16891121

- UK community interest company teaching AI safety, digital inclusion, and practical AI for health and everyday life.
- Built a key-free UK grant scraper with weekly capture across four funding bodies, and a self-hosted OSINT forecast system.

EARLIER CAREER

Human Architect / Alkaline Architect

Founder, content creator, author · 2013–2024

- Built an online school to 2,000+ students and designed every course.
- Grew organic social content to around 20 million views a month through daily on-camera video.
- Wrote six books under a pen name on health, nutrition, addiction, brain rewiring and disease prevention.

CAPABILITIES

Agent design. Write the job spec, decision boundary and escalation path before an agent touches real work. Human sign-off stays on anything that changes money, data or commitments.

Loop engineering. Structure how agents execute, where they stop, and how they recover when the answer is wrong. The pass test comes first; the diff is the proof.

Graph engineering. Map how work moves between people, tools and models so dependencies are visible and delays avoidable.

Reasoning design. Shape how models reason before they answer: prompts, rules, context windows and decision boundaries.

Agent operations. Configure, run and audit autonomous systems in production with human oversight on consequential actions.

Security and oversight. Review data access, automated actions and operating boundaries. Apply AI security auditing to agent workflows.
